PROFESSIONAL SUMMARY

CCNA-certified network professional with 4 years of experience across federal, enterprise, and MSP environments. Served as primary troubleshooting resource during a 50,000+ user Zscaler migration at FAA while maintaining 90-95% first-contact resolution across 100+ weekly tickets in mission-critical infrastructure. Lab-proven in multi-area OSPF, eBGP/IGP integration, Zero-Trust segmentation, IDS/IPS deployment, - targeting Network Administrator and Engineer roles where that depth gets put to work.

CERTIFICATIONS

- Cisco Certified Network Associate (CCNA)
- CompTIA Security+
- CompTIA Network+
- CompTIA A+

TECHNICAL SKILLS

Networking: TCP/IP, VLANs, Inter-VLAN Routing, Subnetting, DHCP, DNS, NAT/PAT, OSPF, EIGRP, HSRP, STP

Security: Firewall Policy, Zero-Trust Segmentation, DMZ, IDS/IPS (Suricata), Zscaler, IPsec VPN

Cloud: Azure Virtual Networks, NSGs, RBAC, Microsoft Entra ID, Hybrid Networking

Systems & IAM: Windows Server, Active Directory, Group Policy, Microsoft 365, MFA

Tools & Labs: Wireshark, ServiceNow, GNS3, CML, Packet Tracer, Azure Portal

WORK EXPERIENCE

IT Support Technician | SAIC — Contracted to FAA

2024 – Present

- Served as primary troubleshooting resource during an FAA-wide migration from Ivanti Secure Access to Zscaler across 50,000+ users – conducting pre-rollout testing and resolving end-user connectivity issues in real time during cutover to protect continuity at scale.
- Diagnosed a recurring post-password-reset logout pattern caused by cached mobile credentials conflicting with Active Directory – identified the root cause, developed the fix, and worked with management to publish it as a KBA, eliminating repeat escalations across the team.
- Resolved DNS, DHCP, VPN, and MFA connectivity incidents across a large-scale federal user base
- Maintained 90-95% first-contact resolution across 50+ weekly tickets in a mission-critical federal environment, reducing escalations and protecting SLA compliance.

Systems Engineer | National Networks LLC

2023 – 2024

- Managed network stability across 40+ multi-site client environments supporting 500+ users – diagnosing and resolving DNS, DHCP, VPN, and connectivity escalations as the primary point of contact for MSP client issues.
- Executed firewall rule updates and network segmentation changes across multiple client environments, keeping security policy enforced as client infrastructure changed.
- Built internal runbook for recurring failure patterns, cutting repeat escalations and improving resolution speed across the team without senior engineer involvement.

IT Help Desk Technician | Stuller Inc.

2022 – 2023

- Resolved helpdesk tickets for 1,000+ enterprise users across manufacturing and e-commerce operations, maintaining high first-contact resolution on hardware, software, and connectivity issues.
- Identified and escalated network-layer issues to the infrastructure team with clear diagnostic context – reducing time to resolution by arriving at escalations with root cause already narrowed down.

NETWORK ENGINEERING PROJECTS

Enterprise Campus Routing & Redundancy Lab

- Built a full hierarchical campus topology (core/distribution/access) with multi-VLAN segmentation and Layer 3 inter-VLAN routing — designed to production network standards.

- Implemented multi-area OSPF with Area 0 backbone and ABR design: applied route summarization and prefix filtering at the distribution layer to optimize the LSDB and control advertisement boundaries.
- Deployed HSRP with priority/preemption tuning and measured gateway failover convergence time under simulated device failure — validating redundancy before it's needed in production.
- Diagnosed OSPF adjacency failures and routing inconsistencies using structured fault isolation — building the same methodology used in live NOC environments.

Zero-Trust Enterprise Firewall & Network Segmentation Lab

- Engineered isolated User, Server, DMZ, and Management zones with explicit east-west deny policies — enforcing Zero-Trust principles that prevent lateral movement if a segment is compromised.
- Published an IIS web server via controlled NAT port forwarding in the DMZ, restricting server egress to HTTP/HTTPS only to block reverse shell and beaconing vectors.
- Deployed Suricata IDS/IPS with the Emerging Threats Open ruleset and scoped HOME_NET definition for accurate, low-noise intrusion alerting.
- Ran adversarial recon with Kali Linux to validate firewall enforcement, confirm lateral movement containment, and verify alert logging — treating the lab like a real threat scenario.

ISP BGP Network LAB

- Simulated a multi-AS ISP environment in GNS3 using eBGP to represent internet connectivity between autonomous systems – replicating how real ISPs exchange routing information at the boundary.
- Deployed EIGRP as the internal IGP with each ISP's autonomous system to establish next-hop reachability between ISP routers – enabling eBGP sessions to form and remain stable across the AS.
- Validated end-to-end route advertisement and inter-AS connectivity across multiple routers and autonomous systems.
